

Massive-Wood-House

(solid **stauss®**-plasterwall & waterrepellent **Bau-europel®**-insulation)

arguments for brick + wood combined
relative advantages replace the disadvantages

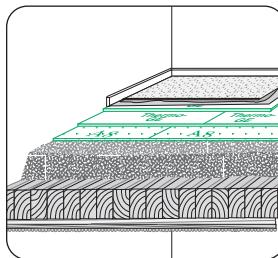

top-performing walls, no hazards
avoiding „prefabricated“ problems

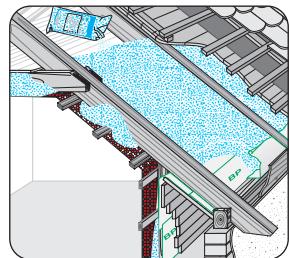

fire-proof
earthquake-safe
flood-retardant
impact-resistant
load-carrying

passive-house
quick-built

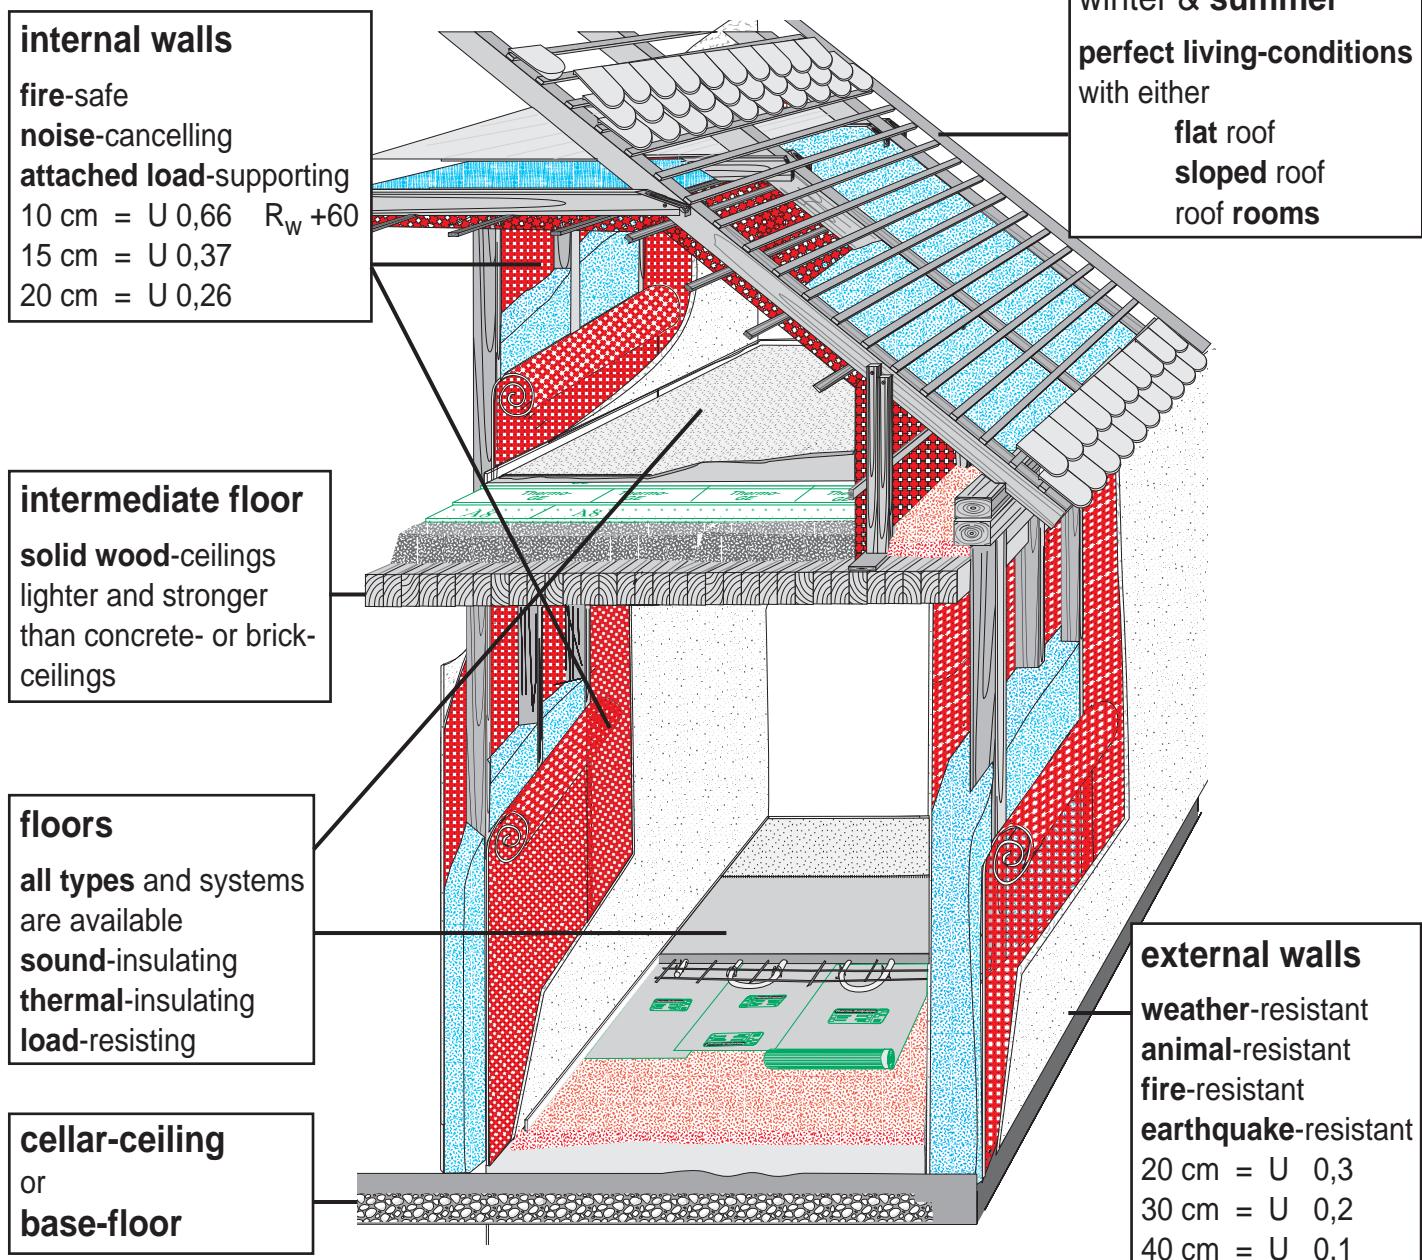

solid brick properties:
sound-insulation
energy-storing
comfort-conditions
wood properties:
impact-resistant
thermal-insulation
time saving

stauss® - more than 100 years success in facades,
Bau-europel® - the original „core insulation“ since 50 years.

System

strength wood-beams carrying vertical loads
reinforced plaster (stauss) carrying horizontal loads
combined as sandwich perfect for static & oscillating loads

insulation ideal, dry-staying thermal-insulation-core
sound-flexible mass as sound-cancelling shell
light, sound-absorbing sound-cancelling core

protection massive (impact-, fire-, animal-resistant), non organic plaster shell
non-compressible, elastic (brake-resistant) framework-core

Naturprodukte

✓ perfect living-conditions

- 👉 permits **diffusion & avoids** collected moisture
- 👉 **free** of contaminations by fungi & microorganisms
- 👉 **summer** - nice cool
- 👉 **winter** - cosy warm

✓ dependable protection

- 👉 **fire-protection** (non combustible A1, rated up to F-400)
- 👉 **sound-protection** ($R_W = 65$ dB up to exceeding 80 dB)
- 👉 **building-protection** (weather-, impact- & animal attack resistance)
- 👉 **lightning-protection** (high voltage- u. high frequency shield)
- 👉 **earthquake-protection** (as well as instable mining areas or hillsides)
- 👉 **flood-protection** (mechanically strong & dries easily)

✓ economy perfected

- 👉 **best price-performance-ratio**
- 👉 **small area wall-occupation**
- 👉 **unlimited service life** (proven over 100 years)
- 👉 **fast & economical** (logistics & construction)
- 👉 **easy application** (simple products, no special tools or skills)
just simple, local wood- and plasterwork

✓ perfect ecology

- 👉 **from nature - for nature**
- 👉 **biological & ecological pioneer** (ISO, EMAS)
- 👉 **radioesthetic-neutral** (no Faraday shield)
- 👉 low voltage and long-wave permittable
- 👉 **unlimited application & unrestricted disposal**

environment supporting - to human benefit

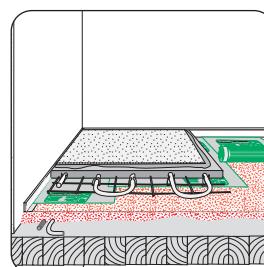

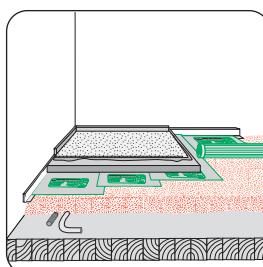

available options:

Floors

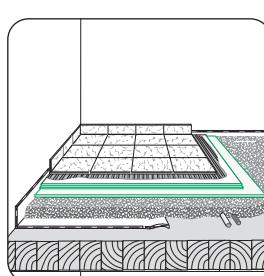

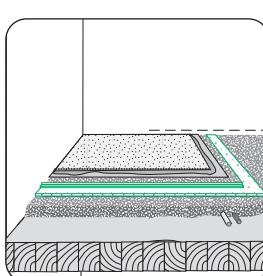

intermediate ceilings (solid woodlayer ceiling)

construction with	[cm]	U-value [Wm²/K]	L _{n,T,W} [dB]
Thermo-Floor®	5	0,32	~ 34,8
	10	0,23	~ 34,6
	12	0,21	~ 34,4
	15	0,18	~ 34,3
	18	0,16	~ 34,1
	20	0,15	~ 34,0
	25	0,13	~ 34,0
	30	0,11	~ 34,0

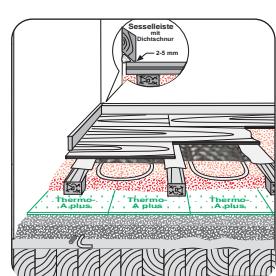

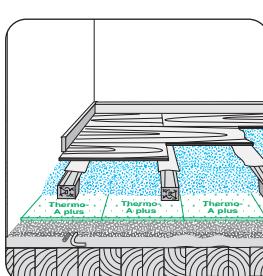

wet floor construction
all kind of covers
with or without heating

Thermo-Plan B1	5	0,33	~ 37,5
	10	0,25	~ 36,5
	12	0,23	~ 36,4
	15	0,20	~ 36,3
	18	0,18	~ 36,1
	20	0,17	~ 36,0
	25	0,15	~ 36,0
	30	0,13	~ 36,0

dry floor construction
for textile covers
for ceramic covers
for floating woodtiles
(parquet)

Thermo-Floor®	5	0,24	~ 46,0
Thermo-Plan®	4		
Thermo-Floor®	5	0,19	~ 44,5
Thermo-Plan®	10		
Thermo-Floor®	8	0,17	~ 44,5
Thermo-Plan®	10		
Thermo-Floor®	8	0,14	~ 44,3
Thermo-Plan®	15		

woodflooring
boards and parquet

ground and basement ceilings (massive ceiling)

the same constructive sections of above intermediate ceilings perform on ground or basement as:

wood construction

dry construction

wet construction

	[cm]	[Wm²/K]	[dB]
Thermo-Floor®	5	0,36	~ 46,0
Thermo-Plan®	4		
Thermo-Floor®	5	0,26	~ 44,5
Thermo-Plan®	10		
Thermo-Floor®	8	0,22	~ 44,5
Thermo-Plan®	10		
Thermo-Floor®	8	0,18	~ 44,3
Thermo-Plan®	15		

	[cm]	[Wm²/K]	[dB]
Thermo-Plan B1	8	0,44	~ 36,7
	10	0,38	~ 36,5
	15	0,28	~ 36,3
	20	0,22	~ 36,0
	25	0,18	~ 36,0
	30	0,16	~ 36,0
	35	0,14	~ 36,0
	40	0,12	~ 36,0

	[cm]	[Wm²/K]	[dB]
Thermo-Floor®	8	0,41	~ 34,7
	10	0,34	~ 34,6
	15	0,24	~ 34,3
	20	0,19	~ 34,0
	25	0,15	~ 34,0
	30	0,13	~ 34,0
	35	0,11	~ 34,0
	40	0,10	~ 34,0

Regardless of insulation values we recommend minimum thicknesses of 15 to 18 cm, better 20 cm. This due to embedded installations as water and electrics (6cmDrain+2cmSlope,4cmBow=12cm,+2,5cmWaterlines+2x2cmCovering=16cm, more for electrics?)

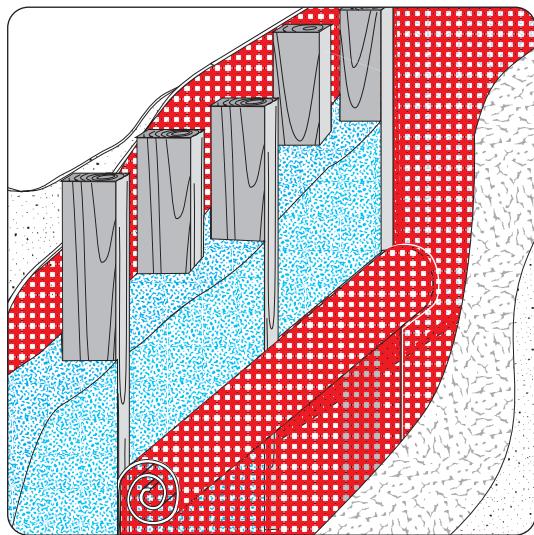

Walls

external walls and super-soundproofing intermediate walls

tailored to the targeted thermal classification following wall designs can be selected:

standard class:	$U = 0,35 \text{ Wm}^2/\text{K}$	$d_{\text{insul}} = 11 \text{ cm}$	$d_{\text{allover}} = 17 \text{ cm}$
energy class:	$U = 0,3$	$d_{\text{insul}} = 13$	$d_{\text{allover}} = 19$
low energy class:	$U = 0,2$	$d_{\text{insul}} = 20$	$d_{\text{allover}} = 26$
passive class:	$U = 0,12$	$d_{\text{insul}} = 34$	$d_{\text{allover}} = 40$

Wa-50s

external wall insulation	Wa-50s [cm]	U-value [Wm ² /K]	R _w [dB]
Thermo-Fill®S	10	0,38	60+
	15	0,26	60+
	20	0,20	60+
	25	0,16	60+
	30	0,13	60+

Ceilings

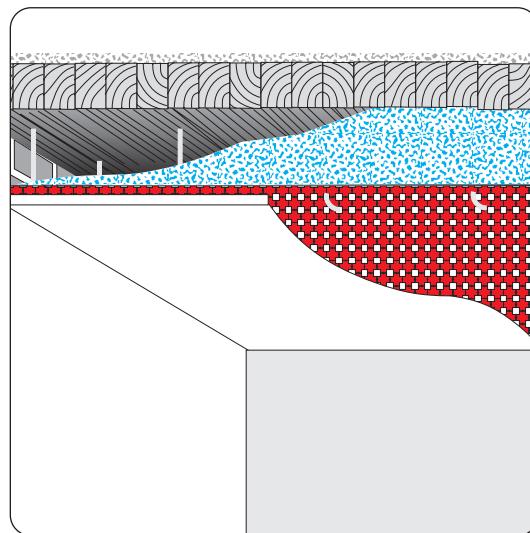

Performances (thermal and sound) are covered in page 4 „flooring“.

Intermediate floor

The recommended solid woodlayer construction can be applied without or with bottom cover. The ceiling design „De-1“ (stauss with plaster) is perfect for super-soundproofing (additional ΔL_n 24dB, ΔR_w 19 dB), improving fire ratings (A1, F-400) and/or increasing mass for improving energy storage (40-85 kg/m²).

De-12

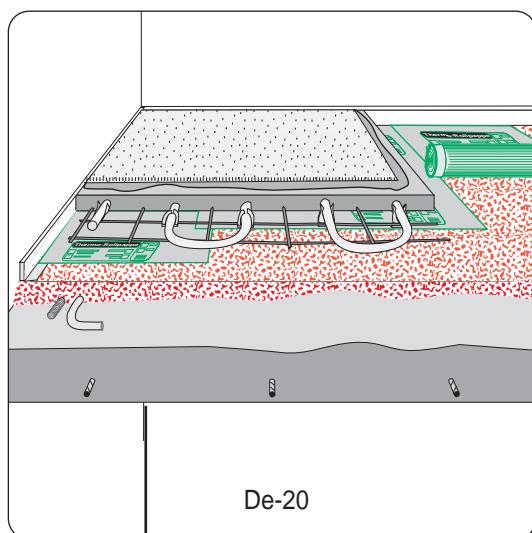

De-1 under De12

basements or groundbases

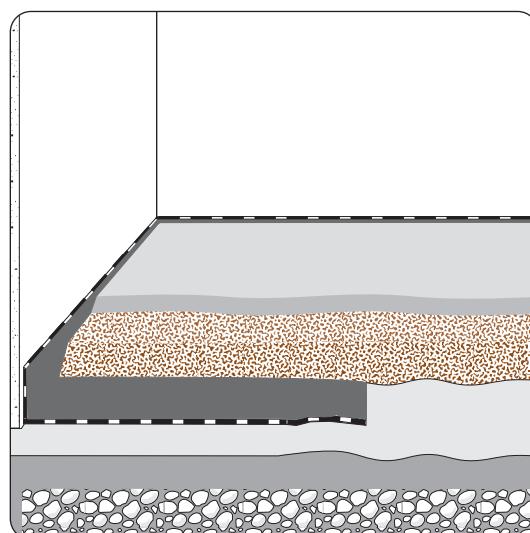

tailored to the targeted thermal classification following floor designs can be selected:

standard class:	$U = 0,4 \text{ Wm}^2/\text{K}$
energy class:	$U = 0,35$
low energy class:	$U = 0,25$
passive class:	$U = 0,15$

z.B. Bo-1: $d_{\text{insul}} = 8 \text{ cm}$	$d_{\text{allover}} = 35 \text{ cm}$
$d_{\text{insul}} = 10$	$d_{\text{allover}} = 37$
$d_{\text{insul}} = 15$	$d_{\text{allover}} = 42$
$d_{\text{insul}} = 25$	$d_{\text{allover}} = 52$

De-20

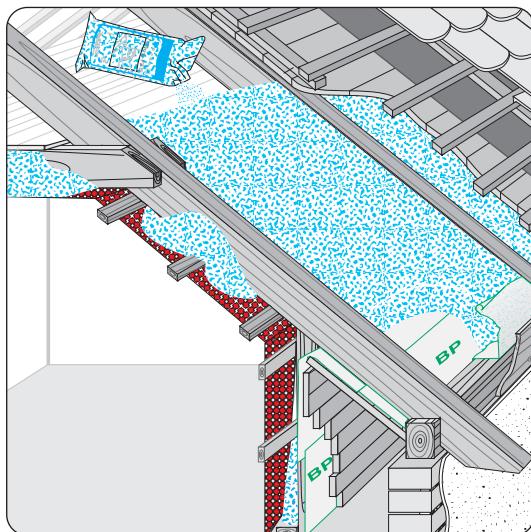

Roofs

Roofrooms with attics

the optimum for comfort and storage

Da-1

roof insulation	Da-1 [cm]	U-Wert [Wm²/K]	d _{ges} [cm]
Thermo-Fill S	10	0,29	21
	15	0,18	26
	20	0,15	31
	25	0,13	36
	30	0,11	41
	35	0,10	46
	40	0,09	51
	45	0,08	56
	50	0,07	61

thicknessS without roofing

for effective summer heat insulation:

minimum: $d_{insul} = 20 \text{ cm}$

$d_{total} = 31 \text{ cm}$

standard: $d_{insul} = 25 \text{ cm}$

$d_{total} = 36 \text{ cm}$

comfort: $d_{insul} = 30 \text{ cm}$

$d_{total} = 41 \text{ cm}$

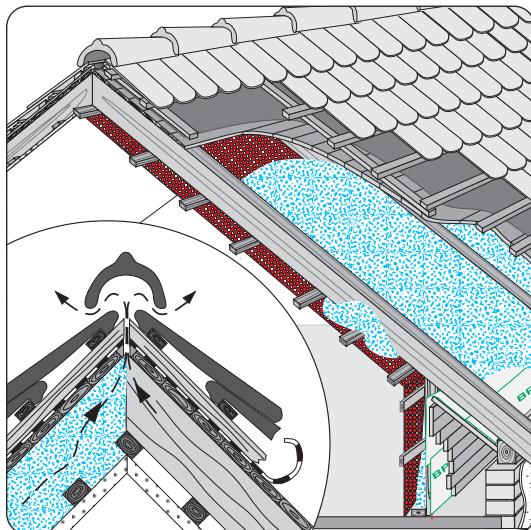

tailored to the targeted thermal classification following roof designs can be selected:

standard class:	$U = 0,3 \text{ Wm}^2/\text{K}$	$d_{insul} = 6 \text{ cm}$	$d_{allover} = 17 \text{ cm}$
energy class:	$U = 0,2$	$d_{insul} = 12 \text{ cm}$	$d_{allover} = 23 \text{ cm}$
low energy class:	$U = 0,15$	$d_{insul} = 19 \text{ cm}$	$d_{allover} = 30 \text{ cm}$
passive class:	$U = 0,09$	$d_{insul} = 38 \text{ cm}$	$d_{allover} = 49 \text{ cm}$

Roofrooms up to the top

for freedom of design and medium climatic conditions
performances and values (insulation, thickness) are as above in „Da-1“.

Da-1a

Regardless of room to the top, flat roof or curved roof: ventilation for vapour at the highest option is mandatory.

Visible woodbeams: it is recommended not to interrupt fire protection as energy storage. Therefore stauss/plaster is applied throughout in 1 layer and „visible“ dummy beams are mounted on top. This is the most economical and safest way (installations can be rooted in them, too).

Simple wood-construction

It creates the capacities for pneumatically applied insulation. Water, electric, antennas and other applications can be routed in here without additional insulations.

receiving „roll-on-brick“

externally applied first, internally mounted when tubes, ducts,... have been installed.

easy covered

no slots, no open joints, no formaldehyde.

Adjusts to any form.

single piece walls
without extension joints
without barriers or plastic liners
fully functional **ecological** wind barrier
optimised protection regarding
fire, thermal, sound
as well as
floods & earthquakes

plaster is applied

Lime cement as lime plasters are perfect ecological options. Energy saving performances can be influenced with corresponding plaster thicknesses.

internally

ample room for insulation and ducting, lines etc., plastered staus offers more strength for woodframes than boards or woodlayers would do (earthquake, storm)

wind barrier

pure paper, no plastic or perforated „diodes“ delivers air stoppage and capillary moisture evacuation.

energy storage and strength of massive walls

traditional or futuristic
flat or curved
plaster or wood decorations

unrestricted options
safe & reasonable
